Hello, my name is
Talisman Terry, your
friendly Fracosaurus.
I am here to teach you
about a clean energy source
called Natural Gas, found
right here in the Twin Tiers!

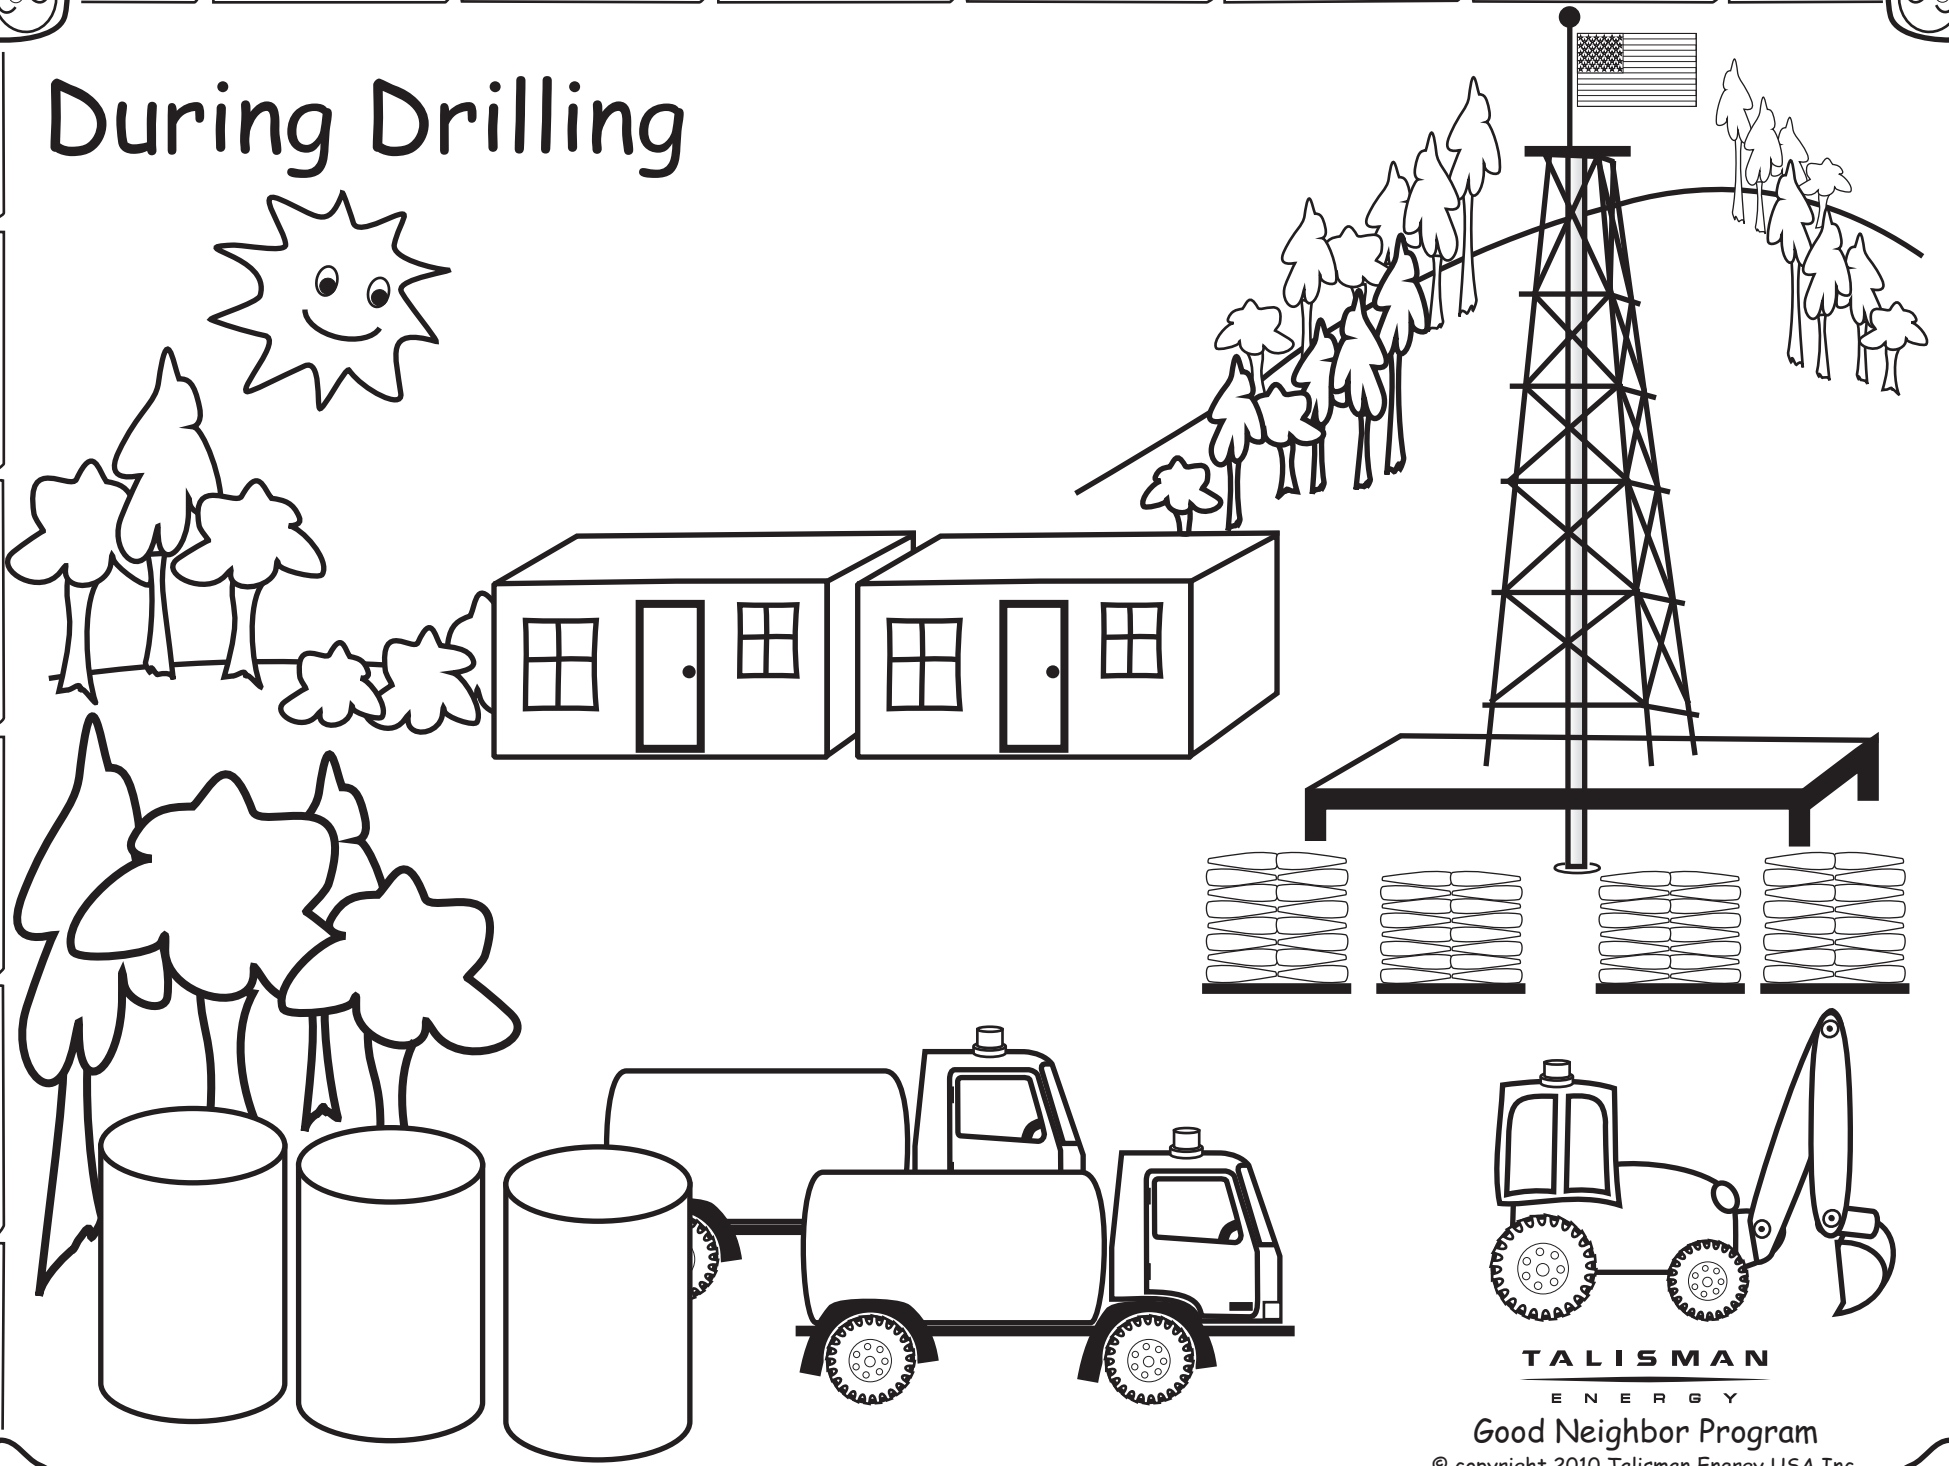

Natural gas is a clean-burning fossil fuel. It is one of the cleanest, safest, and most useful of all energy sources.

After Drilling

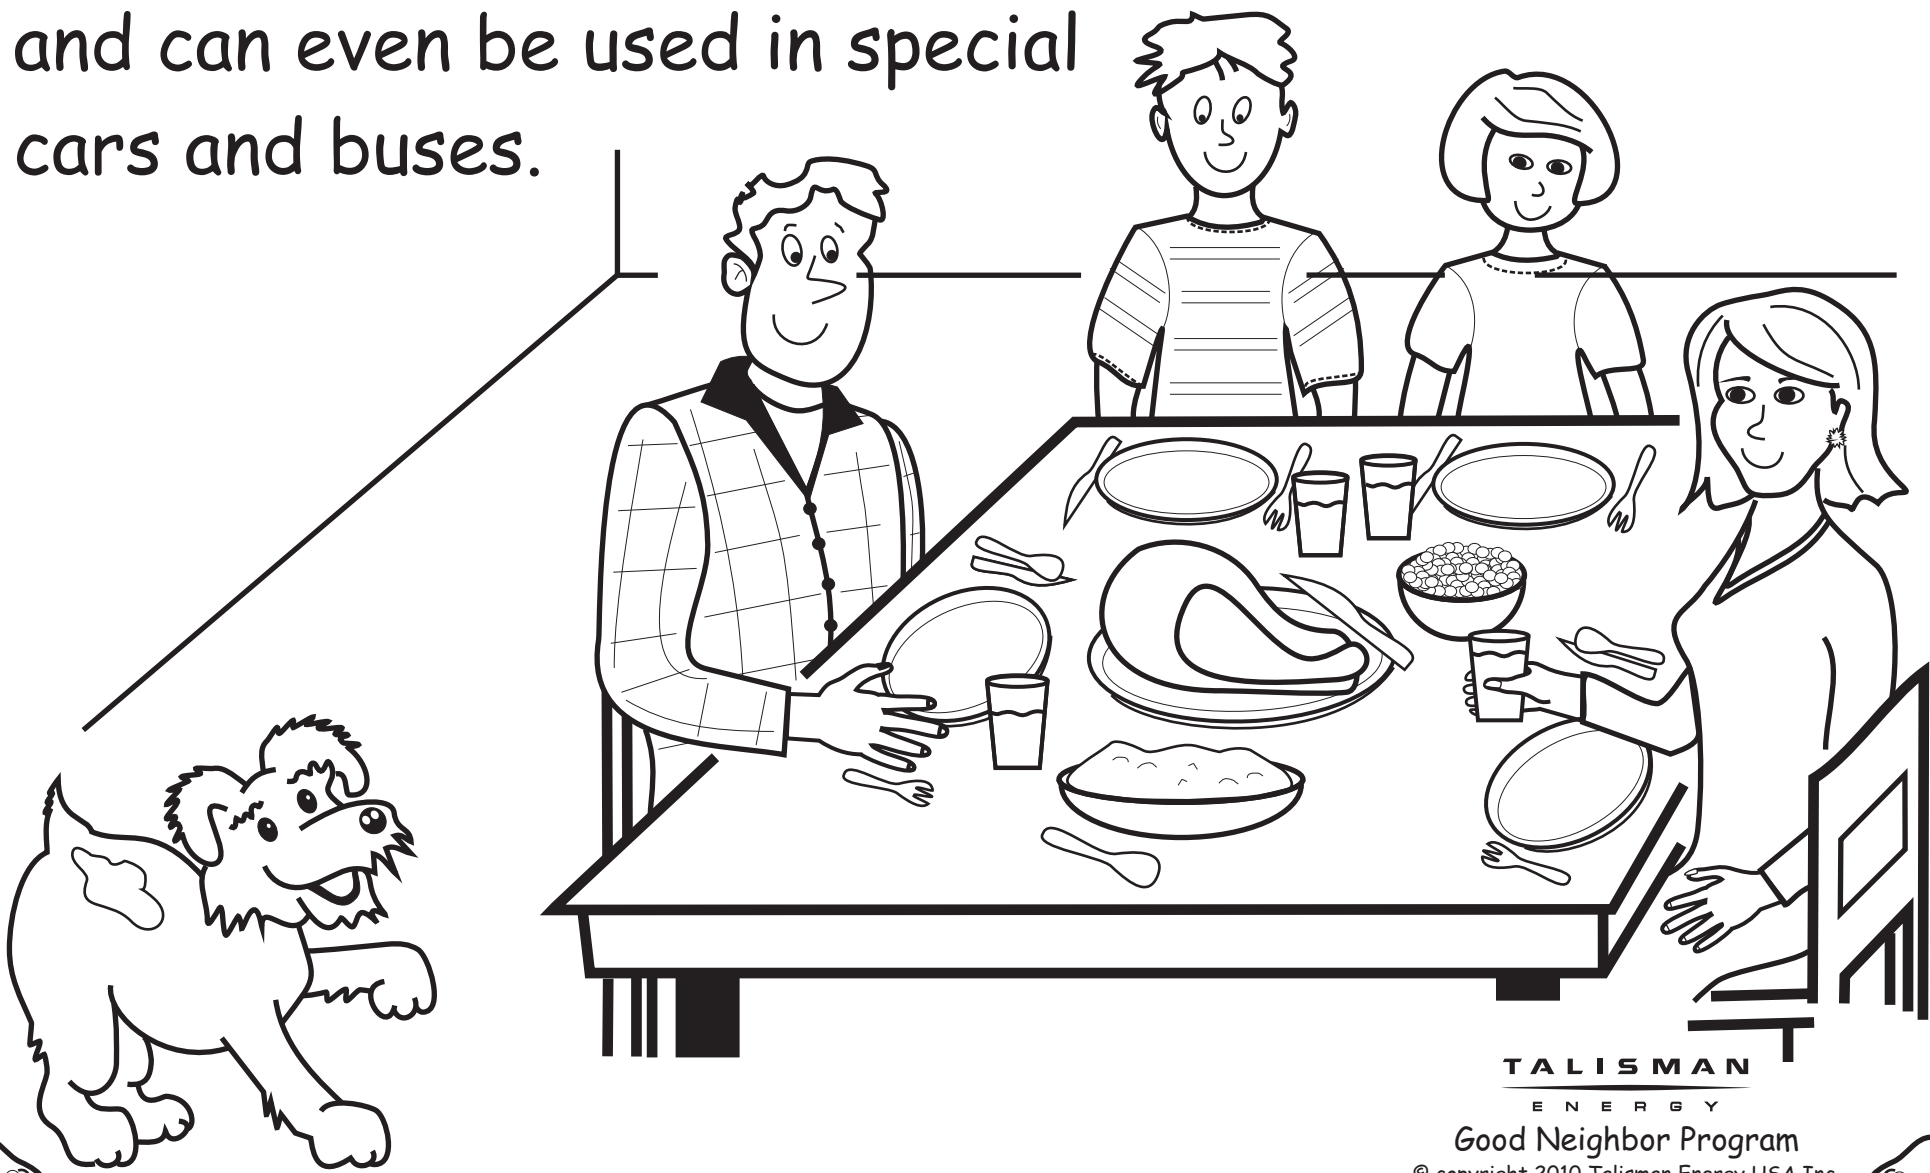

During Drilling

Natural Gas is used to heat our homes,
to cook our meals, to heat our water,
and can even be used in special
cars and buses.

Natural gas comes directly to our homes through a gas pipeline. The gas company reads a gas meter on the outside of our house to see how much gas we use each month.

Before Drilling

Because there is only so much gas under the ground, one day the well stops producing gas. At this time, the well is closed, and the land is reclaimed and returned to the way it was before Talisman came to drill.

*How is
Natural Gas formed?*

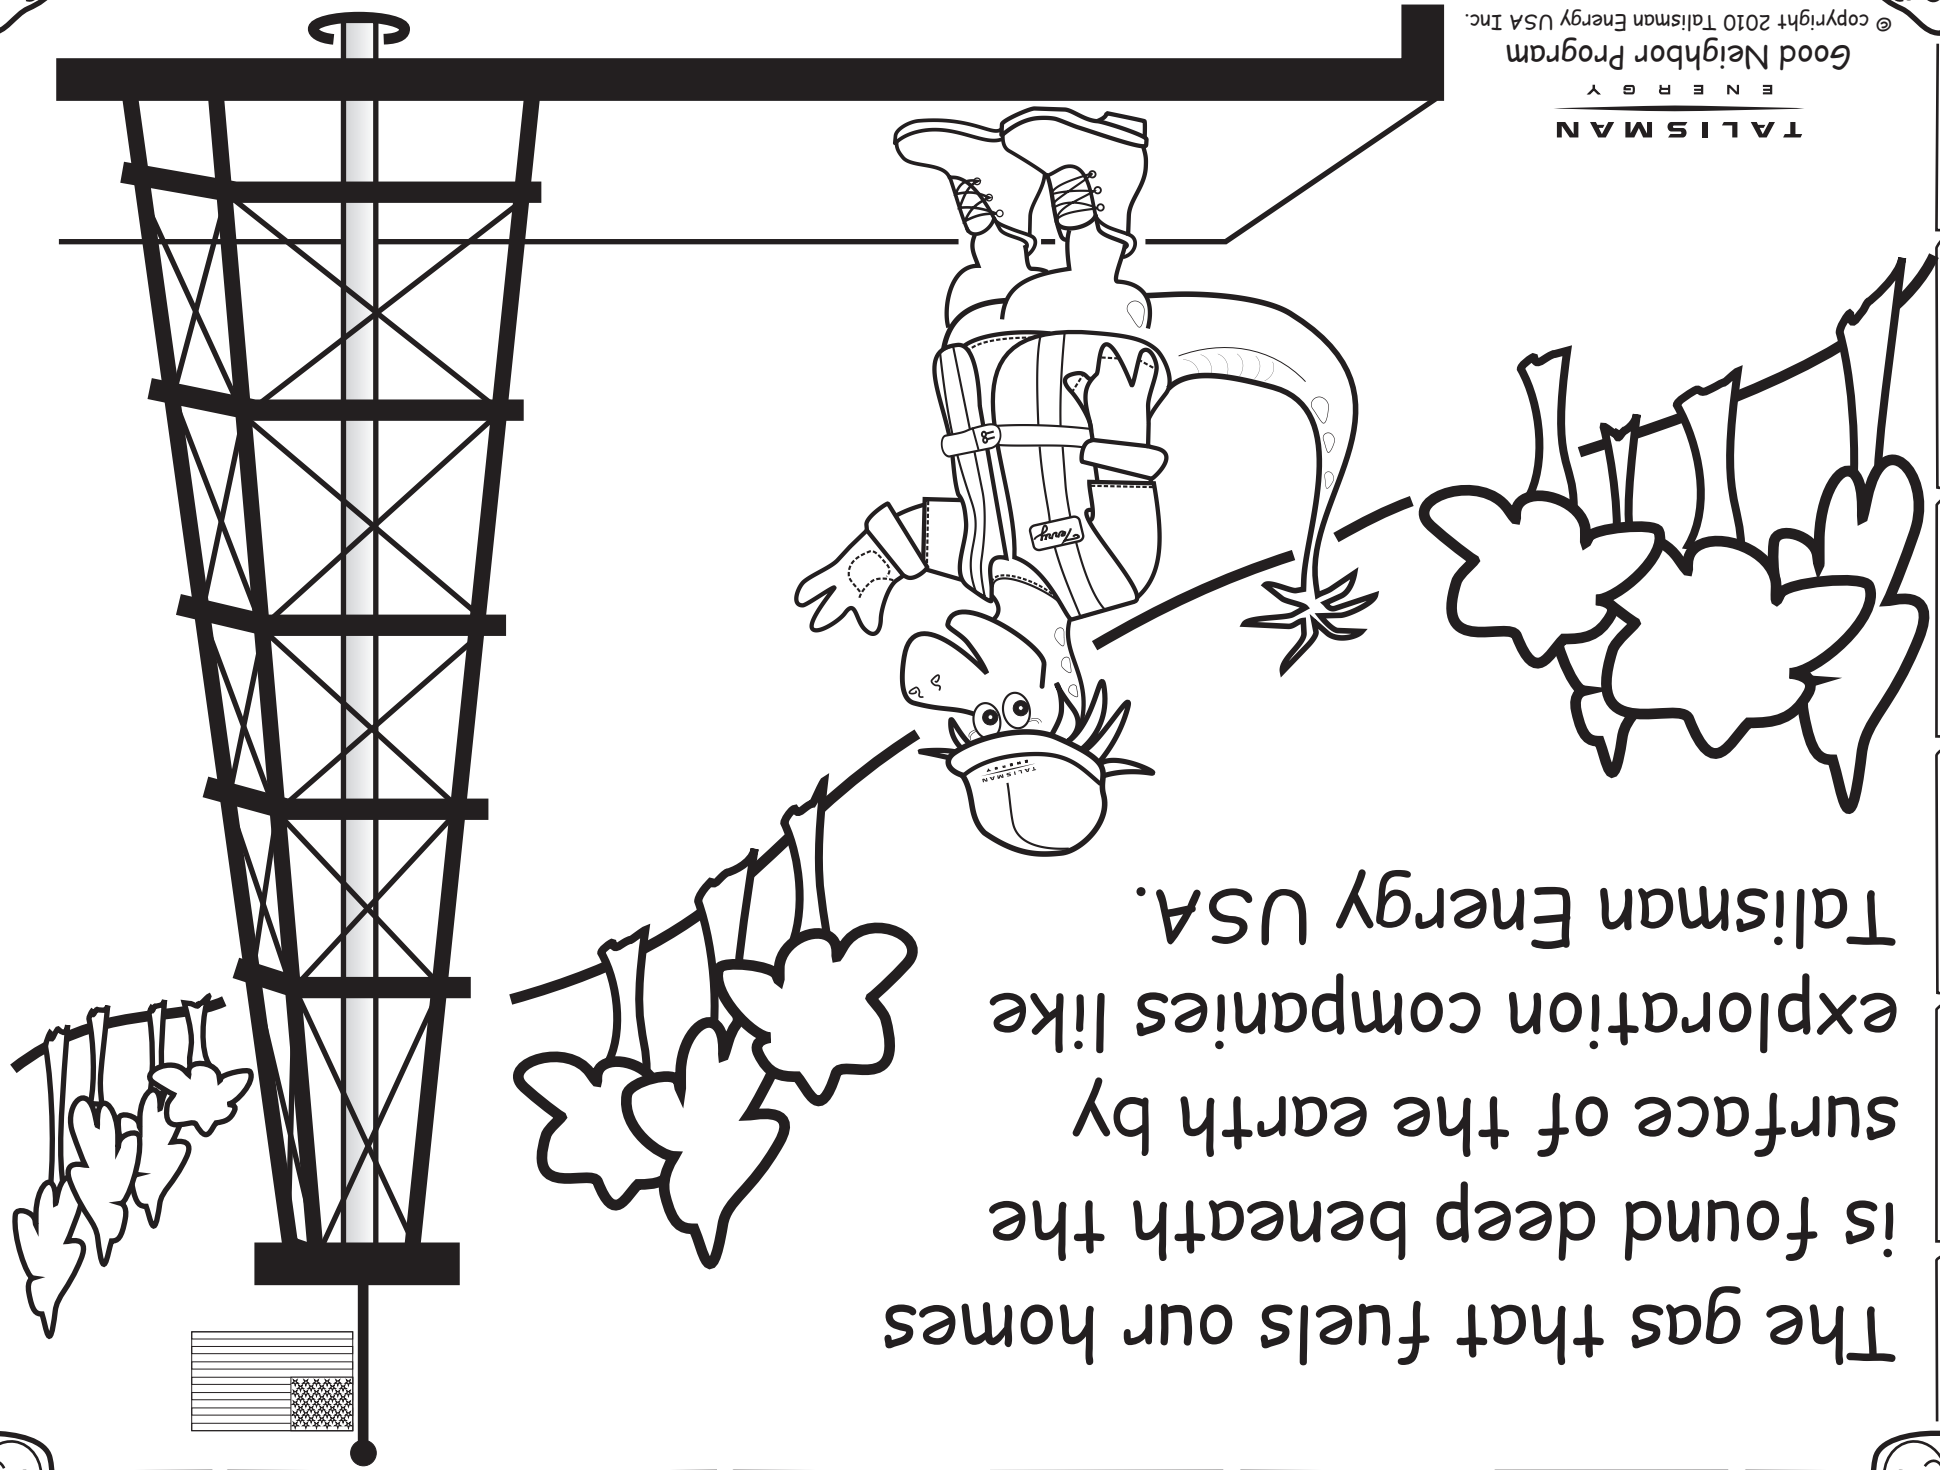

But where does Natural Gas come from and how does it get to our homes?

The gas that fuels our homes is found deep beneath the surface of the earth by exploration companies like Talisman Energy USA.

Each well is different depending on how much gas is underneath the ground. Some wells may produce for a short period of time, while others may produce gas for many years.

Once the well begins producing natural gas, a gathering system is needed to collect it. Pipes are connected to capture the natural gas and deliver it to customers.

Over millions of years, heat and pressure below the earth's surface creates fossil fuels like natural gas from organic material.

Geologists study rocks and perform special tests to find the gas deep in the ground.

During the drilling process, you may see a lot of big equipment, including a drill rig, large trucks, and tanks of water.

The well may be more than a mile deep when it is complete! That is equivalent to the height of 15 or more California Redwoods, the earth's tallest tree, stacked on top of each other.

Because natural gas is lighter than air, it will rise up to the earth's surface when it is set free from underground rocks.

Once Talisman knows where the right kind of underground rock is, it works with the property owners to get permission to drill.

The area where the well will be drilled is cleared, with the dirt saved so that it can be used later on to reclaim the land. This means it will look the same as before, once the well is no longer in use.
